

NUMBER SYSTEMS

**Numbers are intellectual witnesses that belong only to mankind.**

1. If the H C F of 657 and 963 is expressible in the form of  $657x + 963y - 15$  find  $x$ .  
(Ans:  $x=22$ )

**Ans:** Using Euclid's Division Lemma

$$a = bq + r, 0 \leq r < b$$

$$963 = 657 \times 1 + 306$$

$$657 = 306 \times 2 + 45$$

$$306 = 45 \times 6 + 36$$

$$45 = 36 \times 1 + 9$$

$$36 = 9 \times 4 + 0$$

$$\therefore \text{HCF}(657, 963) = 9$$

$$\text{now } 9 = 657x + 963y \quad (-15)$$

$$657x = 9 + 963 \times 15$$

$$= 9 + 14445$$

$$657x = 14454$$

$$x = 14454/657$$

$$x = 22$$

2. Express the GCD of 48 and 18 as a linear combination. (Ans: Not unique)

$$A = bq + r, \text{ where } 0 \leq r < b$$

$$48 = 18 \times 2 + 12$$

$$18 = 12 \times 1 + 6$$

$$12 = 6 \times 2 + 0$$

$$\therefore \text{HCF}(18, 48) = 6$$

$$\text{now } 6 = 18 - 12 \times 1$$

$$6 = 18 - (48 - 18 \times 2)$$

$$6 = 18 - 48 \times 1 + 18 \times 2$$

$$6 = 18 \times 3 - 48 \times 1$$

$$6 = 18 \times 3 + 48 \times (-1)$$

$$\text{i.e. } 6 = 18x + 48y$$

$$\therefore x = 3, y = -1$$

$$\begin{aligned}
6 &= 18 \times 3 + 48 \times (-1) \\
&= 18 \times 3 + 48 \times (-1) + 18 \times 48 - 18 \times 48 \\
&= 18(3+48) + 48(-1-18) \\
&= 18 \times 51 + 48 \times (-19) \\
6 &= 18x + 48y
\end{aligned}$$

$\therefore$

$x = 51, y = -19$
-------------------

Hence, x and y are not unique.

3. Prove that one of every three consecutive integers is divisible by 3.

**Ans:**

$n, n+1, n+2$  be three consecutive positive integers

We know that  $n$  is of the form  $3q, 3q+1, 3q+2$

So we have the following cases

Case – I when  $n = 3q$

In this case,  $n$  is divisible by 3 but  $n+1$  and  $n+2$  are not divisible by 3

Case - II When  $n = 3q + 1$

Sub  $n+2 = 3q+1+2 = 3(q+1)$  is divisible by 3. but  $n$  and  $n+1$  are not divisible by 3

Case – III When  $n = 3q + 2$

Sub  $n+1 = 3q+2+1 = 3(q+1)$  is divisible by 3. but  $n$  and  $n+2$  are not divisible by 3

Hence one of  $n, n+1$  and  $n+2$  is divisible by 3

4. Find the largest possible positive integer that will divide 398, 436, and 542 leaving remainder 7, 11, 15 respectively.  
(Ans: 17)

Ans: The required number is the HCF of the numbers

Find the HCF of 391, 425 and 527 by Euclid's algorithm

$$\therefore \text{HCF}(425, 391) = 17$$

Now we have to find the HCF of 17 and 527

$$527 = 17 \times 31 + 0$$

$$\therefore \text{HCF}(17, 527) = 17$$

$$\therefore \text{HCF}(391, 425 \text{ and } 527) = 17$$

5. Find the least number that is divisible by all numbers between 1 and 10 (both inclusive).

(Ans: 2520)

**Ans:** The required number is the LCM of 1, 2, 3, 4, 5, 6, 7, 8, 9, 10

$$\therefore \text{LCM} = 2 \times 2 \times 3 \times 2 \times 3 \times 5 \times 7 = 2520$$

6. Show that 571 is a prime number.

**Ans:** Let  $x=571 \Rightarrow \sqrt{x}=\sqrt{571}$

Now 571 lies between the perfect squares of  $(23)^2$  and  $(24)^2$

Prime numbers less than 24 are 2, 3, 5, 7, 11, 13, 17, 19, 23

Since 571 is not divisible by any of the above numbers

571 is a prime number

7. If d is the HCF of 30, 72, find the value of x & y satisfying  $d = 30x + 72y$ .

(Ans: 5, -2 (Not unique))

**Ans:** Using Euclid's algorithm, the HCF (30, 72)

$$72 = 30 \times 2 + 12$$

$$30 = 12 \times 2 + 6$$

$$12 = 6 \times 2 + 0$$

$$\text{HCF}(30, 72) = 6$$

$$6 = 30 - 12 \times 2$$

$$6 = 30 - (72 - 30 \times 2) \times 2$$

$$6 = 30 - 2 \times 72 + 30 \times 4$$

$$6 = 30 \times 5 + 72 \times -2$$

$$\therefore x = 5, y = -2$$

$$\text{Also } 6 = 30 \times 5 + 72(-2) + 30 \times 72 - 30 \times 72$$

Solve it, to get

$$x = 77, y = -32$$

Hence, x and y are not unique

8. Show that the product of 3 consecutive positive integers is divisible by 6.

**Ans:** Proceed as in question sum no. 3

9. Show that for odd positive integer to be a perfect square, it should be of the form  $8k + 1$ .

Let  $a = 2m + 1$

**Ans:** Squaring both sides we get

$$a^2 = 4m(m + 1) + 1$$

$\therefore$  product of two consecutive numbers is always even

$$m(m + 1) = 2k$$

$$a^2 = 4(2k) + 1$$

$$a^2 = 8k + 1$$

Hence proved

10. Find the greatest number of 6 digits exactly divisible by 24, 15 and 36.

(Ans: 999720)

**Ans:** LCM of 24, 15, 36

$$\text{LCM} = 3 \times 2 \times 2 \times 2 \times 3 \times 5 = 360$$

Now, the greatest six digit number is 999999

Divide 999999 by 360

$$\therefore Q = 2777, R = 279$$

$$\therefore \text{the required number} = 999999 - 279 = 999720$$

11. If  $a$  and  $b$  are positive integers. Show that  $\sqrt{2}$  always lies between  $\frac{a}{b}$  and  $\frac{a + 2b}{a + b}$

**Ans:** We do not know whether  $\frac{a^2 - 2b^2}{b(a + b)}$  or  $\frac{a}{b} < \frac{a + 2b}{a + b}$

$\therefore$  to compare these two number,

$$\text{Let us compute } \frac{a}{b} - \frac{a + 2b}{a + b}$$

$$\Rightarrow \text{on simplifying, we get } \frac{a^2 - 2b^2}{b(a + b)}$$

$$\therefore \frac{a}{b} - \frac{a+2b}{a+b} > 0 \text{ or } \frac{a}{b} - \frac{a+2b}{a+b} < 0$$

$$\text{now } \frac{a}{b} - \frac{a+2b}{a+b} > 0$$

$$\frac{a^2 - 2b^2}{b(a+b)} > 0 \text{ solve it, we get, } a > \sqrt{2}b$$

Thus, when  $a > \sqrt{2}b$  and

$$\frac{a}{b} < \frac{a+2b}{a+b},$$

We have to prove that  $\frac{a+2b}{a+b} < \sqrt{2} < \frac{a}{b}$

Now  $a > \sqrt{2}b \Rightarrow 2a^2 + 2b^2 > 2b^2 + a^2 + 2b^2$   
On simplifying we get

$$\sqrt{2} > \frac{a+2b}{a+b}$$

Also  $a > \sqrt{2}b$

$$\Rightarrow \frac{a}{b} > \sqrt{2}$$

Similarly we get  $\sqrt{2} < \frac{a+2b}{a+b}$

$$\text{Hence } \frac{a}{b} < \sqrt{2} < \frac{a+2b}{a+b}$$

12. Prove that  $(\sqrt{n-1} + \sqrt{n+1})$  is irrational, for every  $n \in \mathbb{N}$

### Self Practice
